Chapter 1  **Installation and Configuration**

The chapter provides details for obtaining, installing, configuring and running the Funambol DS Server and the Funambol Administration Tool.

**Topics**

- *Introduction, page 2*
- *Installing the Funambol DS Server, page 4*
- *Starting and Stopping the Funambol DS Server, page 8*
- *Configuring the Funambol DS Server, page 11*
**Introduction**

This document is intended for those who manage the Funambol DS Server, and includes the following information:

- Installing and configuring the Funambol DS Server
- Installing and using the Funambol Administration Tool
- Managing Funambol Modules
- Managing Funambol Connectors

**Prerequisites**

The following software should be installed before installing the Funambol DS Server:

- **Java Development Kit** – Java Development Kit 1.4.x or 1.5.x. Ensure that the `JAVA_HOME` environment variable points to the top directory of the JDK.

- **Application Server** – Application servers tested with the Funambol DS Server include Apache Tomcat version 5.0.x and JBoss versions 3.0.x, 3.2.x, and 4.0.x. Other servers may function but have not been tested. Ensure that the `J2EE_HOME` environment variable points to the top directory of the application server.

- **JDBC Compatible Database** – The use of a database by the Funambol DS Server requires that you have created a database with the appropriate permissions for connecting, creating, deleting, reading and writing tables. You also need the JDBC driver for the database, and the connection URL and login information.

**NOTE:** The Funambol DS Server software is available in a bundled package that includes all the software needed to get started with the server; however, a complete JDK is not provided, nor the JDBC driver for databases other than that for Hypersonic. For details, see “Obtaining the Software” on page 3.

For additional information on the above software, see “Resources” on page 68.
Obtaining the Software

You have the following options when you obtain the software.

Bundled Package or Individual Downloads

The Funambol DS Server software is available in a bundled package that includes prerequisite software (i.e., Apache Tomcat 5.0, JRE 1.5.0, and Hypersonic) along with the Funambol Administration Tool, a Java GUI client, and a PIM web demo. This package is available for the convenience of those who want to quickly implement an operational synchronization server.

NOTE: When you install the bundled package, all components are automatically installed (i.e., you cannot select a subset of components to install).

The Funambol DS Server, Funambol Administration Tool, Funambol Connectors, Client Plug-ins, and other Funambol components are also available as individual downloads.

Stable or Developer Release

The following releases are available from the Funambol product release website:

- **Stable release** – contains bundled and individual downloads that are tested for the feature set defined for that version.

- **Developer (beta) release** – contains bundled and individual downloads that include work in progress, and may have additional features. The developer release supports normal Funambol DS Server functionality; however, open issues may be present.

Once you have determined whether to download the bundle or individual components, and whether to use the stable or developer release, you can locate the appropriate download(s) for your operating system.
Installing the Funambol DS Server

This section describes how to install the Funambol DS Server and the Funambol Administration Tool.

Installing the Server With Bundled Software

When you install bundled software, the Funambol Administration Tool and prerequisite software are automatically installed with the server.

Windows

1. Run the executable installation file.

2. Review the license agreement. To accept the terms, select the checkbox and click Next.

3. Accept the suggested Destination Folder, i.e., the \Funambol directory, that we will refer to as <FUNAMBOL_HOME> in this document. The installer will create subdirectories for bundle components under the top-level directory, including a subdirectory for the Funambol DS Server that we will refer to as <DS_SERVER_HOME>, as shown below:

![Diagram](image)

Note the prerequisite application server, Java runtime, and database will be installed in the <FUNAMBOL_HOME>\tools directory.

4. When prompted for a Program Group, specify Funambol (if not already specified).

5. At the completion of the installation, you are given the option to view the readme file and to start the server.
If you choose to start the server, the Funambol icon (two circular arrows) appears in the system tray. The color of the icon indicates the status of the server.

- Green – the server is running.
- Red – the server is stopped.
- Yellow – the server is starting, wait for the icon to become green to access the server.

If the Funambol icon is green, you can verify the server is running by pointing a browser to http://localhost:8080/funambol, where a welcome page to the Funambol DS Server should display.

**Linux**

1. Execute the downloaded file in a shell as follows:
   ```shell
   > sh funambol-<version>.bin
   ```
2. Review the license agreement. To accept the terms, select the checkbox and click Next.
3. Specify a top-level directory in which to install the bundled software. If not specified, the installation defaults to funambol.

**Installing the Server Without Bundled Software**

This section assumes that you have an application server, JDK/JRE, and a JDBC-compliant database installed on your system, or will obtain and install those components.

**Windows and Unix / Linux**

1. Unpack the compressed file. This creates a top-level directory named Funambol that we will refer to as <FUNAMBOL_HOME> in this document. The server is in the \ds-server subdirectory and we will refer to this subdirectory as <DS_SERVER_HOME>.
2. Using a text editor, open the <DS_SERVER_HOME>\install.properties file. Note that commented lines are preceded by the number (#) symbol. We suggest that you take a few moments to read the comments about each parameter.
3. Locate the line `dbms=` and specify the name of your JDBC-compliant database.
4. Locate the following lines and specify values appropriate for your database:
   ```properties
   jdbc.classpath=
   jdbc.driver=
   jdbc.url=
   jdbc.user=
   jdbc.password=
   ```
5. Save and close install.properties. For additional details on this file, see “Install Properties” on page 71.
6. Verify that your `J2EE_HOME` environment variable points to the top-level directory where your application server resides, and the `JAVA_HOME` environment variable points to the top-level directory where the JDK/JRE resides.

7. Stop the application server if it is running.

8. Run the server installation script. Open a command prompt window and type the following at the prompt:

   **Windows:**
   
   ```
   > cd <DS_SERVER_HOME>
   > bin\install <application_server>
   ```

   **Example:**
   
   ```
   > cd "program files\funambol\ds-server"
   > bin\install jboss
   ```

   **Unix/Linux:**
   
   ```
   > cd <DS_SERVER_HOME>
   > sh bin/install.sh <application_server>
   ```

   You will be prompted several times as to whether you want to create/recreate the database; type `y` (yes) for all questions.

9. For instructions on starting the server, see “Starting the Server” on page 8.
Installing the Funambol Administration Tool

When you do not use the bundled software, you need to install the Funambol Administration Tool separately. You can install the Administration Tool on the same machine as the Funambol DS Server, or on a remote machine. Before proceeding, ensure that the version of the Administration Tool matches that of the Funambol DS Server.

Windows

1. Run the executable installation file.
2. Review the license agreement. To accept the terms, select the checkbox and click Next.
3. Accept the suggested Destination Folder, i.e., the \Funambol\admin directory.
4. Accept the suggested Program Group, i.e., Funambol\Funambol Administration Tool.
5. At the completion of the installation, you are given the option to view the readme file and to start the tool.

Unix / Linux

The Administration Tool download for Unix/Linux is a tarball installation file. Perform the following:

```
> cd <FUNAMBOL_HOME>/admin
> gunzip funambol-admin-<version>.tar.gz
> tar xvf funambol-admin-<version>.tar
```
**Starting and Stopping the Funambol DS Server**

The methods for starting and stopping the Funambol DS Server depend on how the application server associated with the server starts and stops J2EE applications. In this section, we assume the Funambol DS Server is installed as a standalone application; therefore, when the Funambol DS Server is stopped, the entire application server is stopped, and when it is started, the entire application server is started.

### Starting the Server

The following commands start the server:

<table>
<thead>
<tr>
<th>Bundled Installation</th>
<th>Unbundled Installation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Windows</strong></td>
<td>Command line:</td>
</tr>
<tr>
<td>Start &gt; All Programs &gt; Funambol &gt; Data Synchronization Server &gt; Start</td>
<td>&gt; cd &lt;DS_SERVER_HOME&gt;</td>
</tr>
<tr>
<td></td>
<td>&gt; bin\start.cmd</td>
</tr>
<tr>
<td></td>
<td>Command line:</td>
</tr>
<tr>
<td><strong>Unix / Linux</strong></td>
<td>&gt; cd &lt;FUNMAMBOL_HOME&gt;</td>
</tr>
<tr>
<td></td>
<td>&gt; sh tools/bin/Funambol.sh start</td>
</tr>
<tr>
<td></td>
<td>&gt; cd &lt;DS_SERVER_HOME&gt;</td>
</tr>
<tr>
<td></td>
<td>&gt; sh bin/start.sh</td>
</tr>
</tbody>
</table>

If you have installed the bundled software, when you start the server, the Funambol icon (two circular arrows) appears in the system tray. The color of the icon indicates the status of the server.

- Green – the server is running.
- Red – the server is stopped.
- Yellow – the server is starting, wait for the icon to become green to access the server.

If the Funambol icon is green, you can verify the server is running by pointing a browser to http://localhost:8080/funambol, where a welcome page to the Funambol DS Server should display. You can also right-click the icon to open a menu that allows you to start or stop the server.

**NOTE:** If you have installed the server as an individual component (not the bundled software), the Funambol icon does not display in the system tray.
Stopping the Server

Windows (bundled installation)

The following actions stop the server:

- Start > All Programs > Funambol > Data Synchronization Server > Stop
- Right-click the icon in system tray and select Stop

**NOTE:** When you right-click the icon in the system tray, you can also select Exit. This terminates the service with which you can see if the server is still running, but does not stop the server, and thus avoids stopping the server if the user disconnects from the desktop.

Unbundled Installation

The method of stopping the Funambol DS Server depends on the application server. For JBoss, perform the following:

If it is running in foreground, press Ctrl+C; if this fails, determine the process id and kill it with an operation system command or tool.

For Tomcat 5.0.x, perform the following:

**Windows**

```
> cd <CATALINA_HOME>
> bin\shutdown.cmd
```

**Unix / Linux**

```
> cd <CATALINE_HOME>
> bin/shutdown.sh
```

In either case, `<CATALINA_HOME>` is the Tomcat installation directory, i.e., `<FUNAMBOL_HOME>\tools\tomcat`. 
Starting and Stopping the Administration Tool

To start the Administration Tool, perform the following:

**Windows**

Start > All Programs > Funambol > Administration Tool

**Unix / Linux**

> cd FUNAMBOL_HOME/admin
> bin/funamboladmin

To stop the Administration Tool, perform the following on the Administration Tool main menu:

File > Exit
Configuring the Funambol DS Server

This section describes the following Funambol DS Server configuration tasks:

- Specifying the Public IP Address
- Changing the Device-ID
- Changing the HTTP Server Port
- Changing the Database

To perform the first two tasks, you use the Administration Tool to modify the appropriate server JavaBean. Server JavaBeans are JavaBeans used server-side. A bean configuration is stored in a serialized form of the bean itself. In this way, a bean can be instantiated, configured and serialized to persist its configuration. Later, the bean can be deserialized in memory as a properly configured instance. For additional details on server JavaBeans, see the Funambol DS Server Developer’s Guide.

To perform the remaining tasks, you modify configuration or properties files.

Specifying the Public IP Address

The default installation provides access to the Funambol DS Server via the localhost; however, in most situations it is necessary to change the IP/hostname to access the server from a remote system. Before proceeding, see “Introduction” on page 18 for general information on using the Administration Tool, and “Server Engine Parameters” on page 22 for information on server JavaBeans.

To change the IP/hostname, perform the following:

1. Start the DS Server.
2. Start the Administration Tool and login to the server.
3. In the navigation pane, expand the server and double-click Server settings.
4. In the Server Settings panel, locate the Server URI property, specify the desired IP address or hostname and click Save.

In the Output message pane, the message “Server configuration saved.” is displayed.
Changing the Device-ID

The Funambol distribution provides a non-rewriting *PipelineManagerGeneric* server JavaBean, as well as a *PipelineManager* server JavaBean (the default); the latter implements the *syncml-phone* device-id override. You have to reset this property to the *com/funambol/server/engine/pipeline/PipelineManagerGeneric.xml* server JavaBean to use real device-ids.

Before proceeding, see “Introduction” on page 18 for general information on using the Administration Tool, and “Server Engine Parameters” on page 22 for information on server JavaBeans.

To change the Pipeline Manager, perform the following:

1. Start the DS Server.
2. Start the Administration Tool and login to the server.
3. In the navigation pane, expand the server and double-click **Server settings**.
4. In the Server Settings panel, locate the Pipeline manager property, specify *com/funambol/server/engine/pipeline/PipelineManagerGeneric.xml* and click **Save**.

In the output message pane, the message “Server configuration saved.” is displayed.

Understanding the Pipeline Manager

The Pipeline Manager constructs and manages input and output pipelines. It is configured with a list of components that build up the input pipeline, and a list of components that build up the output pipeline. A message processing pipeline modifies incoming and outgoing messages, i.e., the message is modified before it goes into the synchronization engine, and the message returned by the synchronization engine is changed before it is sent to the client. The duties of the Pipeline Manager are as follows:

- Create input and output pipelines at initialization
- Provide a way to start the input or output pipeline
- Coordinate the execution of the components in the pipelines
- Keep the “message processing context” (the state of one pipeline execution)

Input and output pipeline components are called *synclets*. For additional details on the Pipeline Manager, see the *Funambol Architecture* document.
Changing the HTTP Server Port

To change the port to which the Funambol DS Server listens, you change the value of the HTTP server port.

**Tomcat Example (non-bundled version)**

Use a text editor to access the `<TOMCAT_HOME>/conf/server.xml` file and find the following lines:

```xml
<!-- Define a non-SSL Coyote HTTP/1.1 Connector on port 8080 -->
<Connector port="8080"
    maxThreads="150" minSpareThreads="25" maxSpareThreads="75"
    enableLookups="false" redirectPort="8443" acceptCount="100"
    debug="0" connectionTimeout="20000"
    disableUploadTimeout="true"
>```

Modify the `Connector port` property to the desired value, save the configuration file, and restart the server.

**NOTE:**

In the bundled version, `server.xml` is in the `<FUNAMBOL_HOME>/tools/tomcat/conf` directory and contains additional comment lines shown below:

```xml
<!-- Define a non-SSL Coyote HTTP/1.1 Connector on port 8080 -->
<!-- Funambol comment: don't modify or remove this Funambol comment! ---->
<Connector port="8080"
    maxThreads="150" minSpareThreads="25" maxSpareThreads="75"
    enableLookups="false" redirectPort="8443" acceptCount="100"
    debug="0" connectionTimeout="20000"
    disableUploadTimeout="true" />
<!-- Funambol comment: don't modify or remove this Funambol comment! ---->
<!-- Note : To disable connection timeouts, set connectionTimeout value to 0 -->
```

These lines comment out the above example and are used by the Funambol icon in the system tray.

**JBoss Example**

1. Access the `deploy/http-invoker.sar/META-INF/jboss-service.xml` file and change any occurrence of port 8080 to the desired value.

2. Access the `deploy/jbossweb-tomcatXX.sar/META-INF/jboss-service.xml` file and change any occurrence of port 8080 to the desired value.

3. Restart the server.
Changing the Database

The bundled distribution includes the Hypersonic database; however, you can use any JDBC-compliant database. We recommend that you use a database you are familiar with, or in a production environment, one that is most suitable. You can use either of the following methods to change the database:

- Modify the install properties file (recommended).
- Modify the application server specific database configuration.

To Modify the Install Properties File

1. Use a text editor to open the `<DS_SERVER_HOME>/install.properties` file. Note that commented lines are preceded by the number (#) symbol.
2. Locate the line `dbms=` and specify the name of your JDBC-compliant database.
3. Locate the following lines and specify values appropriate for your database:
   
   ```
   jdbc.classpath=
   jdbc.driver=
   jdbc.url=
   jdbc.user=
   jdbc.password=
   ```

4. Save and close `install.properties`. For additional details on this file, see “Install Properties” on page 71.
5. Verify that your `J2EE_HOME` environment variable points to the top-level directory where your application server resides, and the `JAVA_HOME` environment variable points to the top-level directory where the JDK/JRE resides.
6. Run the server installation script. Open a command prompt window and type the following at the prompt:

   **Windows:**
   ```
   > cd <DS_SERVER_HOME>
   > bin\install <application_server>
   ```
   
   **Example:**
   ```
   > cd “program files\funambol\ds-server”
   > bin\install jboss
   ```

   **Unix/Linux:**
   ```
   > cd <DS_SERVER_HOME>
   > sh bin/install.sh <application_server>
   ```

   You will be prompted several times as to whether you want to create/recreate the database; type `y` (yes) for all questions.
7. Verify the server is running by pointing a browser to http://<server>:<port>/funambol, where a welcome page to the Funambol DS Server should display.

To Modify the Application Server Specific Database Configuration

After the Funambol DS Server is installed, the configuration of database access is delegated to the application server. The FunambolDS Server uses the JNDI name jdbc/fnblds to acquire a connection from the application server.

For example, with JBoss 3.2, the database connection settings are stored in J2EE_HOME/server/funambol/deploy/funambol-ds.xml. To configure a new data source, edit the file by changing the following values:

```
<connection-url>
<driver-class>
<user-name>
<password>
```

In addition, in order to tell the application server where to find the JDBC driver classes, the file {FUNAMBOL_HOME}/bin/start.bat/sh must be edited and the driver classpath must be appended to the environment variable JBOSS_CLASSPATH. Refer to your application server’s documentation for details on JDBC configuration.

Logging Database Access

The Funambol DS Server does not create a log of database access directly from the classes that use JDBC. A more generic approach is based on P6Log, an open source application that logs all JDBC transactions in a seamless manner for the target application. You just need to configure the application server to use the P6Spy JDBC driver instead of the database driver. P6Spy is configured to access the real database. For information on how to install and configure P6Spy, visit http://www.p6spy.com/documentation/index.htm.

A simple example for configuring the Funambol DS Server to use P6Spy is as follows:

1. Download and install P6Spy using the above link.
2. Copy spy.jar into the <JAVA_HOME>/jre/lib/ext directory.
3. Copy the file <DS_SERVER_HOME>/lib/funambol-sqllog.jar into the <JAVA_HOME>/jre/lib/ext directory (this contains an adapter for P6Spy to the standard Java logging system).
4. Append the <DS_SERVER_HOME>/lib/logging directory to the application server CLASSPATH (this allows P6Spy to access its configuration file spy.properties).
Chapter 2 \hspace{1cm} Using the Funambol Administration Tool

Topics

- Introduction, page 18
- Server Settings, page 21
- Managing Users, page 30
- Managing Devices, page 32
- Managing Principals, page 34
Introduction

The Funambol Administration Tool is the administrative interface to the Funambol DS Server. You can use the Funambol Administration Tool to perform the following tasks:

- Manage Funambol DS Server settings
- Add, edit, and delete users, devices, and principals
- Display installed modules, connectors, and SyncSource types
- Create, edit, and delete SyncSources

Main Window

When you start the Administration Tool, the following window displays:

The main window is partitioned into the following panes:

- Navigation pane – select the server, users, devices, principals or modules to configure.
- Data entry pane – add, edit, delete or search for the item selected in the navigation pane.
- Output Messages pane – displays Administration Tool status messages.
**Server Login**

To perform server administrative tasks, you first need to login to the server. On the main menu bar, select:

File > Login

Alternatively, you can double-click **Funambol Administration Tool** in the navigation pane. The Login window displays:

![Login Window](image)

**Login Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname/IP</td>
<td>Server host or server IP address. If the server is installed on the same machine, localhost will work.</td>
</tr>
<tr>
<td>Port</td>
<td>Port number for accessing the server. The standard port for the bundled installation using Tomcat is 8080.</td>
</tr>
<tr>
<td>User name</td>
<td>User name for server administration. Default: admin.</td>
</tr>
<tr>
<td>Password</td>
<td>Password for server administration: Default: sa. It is strongly advised to change the default password as soon as possible.</td>
</tr>
</tbody>
</table>

After specifying the above values, click **Login**.
After login, your server displays as the root of the tree in the navigation pane. Expand the server to display server settings, users, devices, principals and modules as shown below:
Server Settings

The primary configuration file for the Funambol DS Server, \$DS_SERVER_HOME/config/Funambol.xml, contains global server settings. The Administration Tool provides an interface to this file that you access by double-clicking Server settings in the navigation pane. The following server parameters display:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manufacturer:</td>
<td>Software maker.</td>
</tr>
<tr>
<td>Model:</td>
<td>Software product /component.</td>
</tr>
<tr>
<td>Software version:</td>
<td>Software version number.</td>
</tr>
<tr>
<td>Hardware version:</td>
<td>Hardware version number.</td>
</tr>
<tr>
<td>Firmware version:</td>
<td>Firmware version number</td>
</tr>
<tr>
<td>OEM:</td>
<td>OEM</td>
</tr>
<tr>
<td>Device id:</td>
<td>ID of the device.</td>
</tr>
<tr>
<td>Device type:</td>
<td>Type of the device.</td>
</tr>
<tr>
<td>DTD version:</td>
<td>The supported SyncML DTD version.</td>
</tr>
</tbody>
</table>
**Server Engine Parameters**

For parameters that are server JavaBeans, the specified value is interpreted as the name of a JavaBean, and is searched for in the configpath as the name of a serialized object. If no serialized object is found, the value is considered equal to the name of a class and is searched for in the classpath.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Server URI</strong></td>
<td>This parameter tells the client the URL to use to address the server. It is used when the synchronization server is behind a load balancer, such that the public URL is different from the URL known inside the cluster. If the public and internal URLs are the same, leave this field blank.</td>
</tr>
<tr>
<td><strong>Officer</strong></td>
<td>Server JavaBean representing the security officer. The officer is responsible for authenticating users and authorizing access to DS server resources. This component can be customized in order to perform the authentication against a different system. In such a case, this parameter will reflect the Server JavaBean of the custom component. The default officer authenticates the user in the Funambol DS Server database and automatically creates a new user/principal the first time the user contacts the server.</td>
</tr>
<tr>
<td><strong>Logging configuration</strong></td>
<td>Server JavaBean for logging configuration.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Pipeline manager</td>
<td>Server JavaBean for the Pipeline Manager configuration. The Pipeline Manager constructs and manages input and output pipelines. It is configured with a list of components that build up the input pipeline, and a list of components that build up the output pipeline. A message processing pipeline modifies incoming and outgoing messages, i.e., the message is modified before it goes into the synchronization engine, and the message returned by the synchronization engine is changed before it is sent to the client.</td>
</tr>
<tr>
<td>Handler</td>
<td>SyncSession handler. The session handler is the server component that handles the entire synchronization session. It defaults to com.funambol.server.session.SyncSessionHandler, but it can be replaced by the server JavaBean representing the custom component.</td>
</tr>
<tr>
<td>Persistence store manager</td>
<td>Server JavaBean representing the persistent store manager, which is the component responsible of accessing the persistent store (i.e., the database used internally by the DS server). The default implementation is configured by the server JavaBean com/funambol/server/store/PersistentStoreManager.xml and stores and reads the data to and from a JDBC database; a custom implementation can be configured by specifying a custom server bean.</td>
</tr>
<tr>
<td>Device inventory</td>
<td>Server JavaBean for Device Inventory configuration. The Device Inventory component is responsible for storing information about devices and their capabilities.                                                                                   The default implementation is com/funambol/server/inventory/PSDeviceInventory.xml, which uses the PersistentStoreManager to store and retrieves the devices and their capabilities.</td>
</tr>
<tr>
<td>Data transformer manager</td>
<td>Server JavaBean for Data Transformer Manager configuration. The Data transformer manager is the component responsible for applying transformations to the data provided by a connector. Common transformations are encoding of binary data (e.g., B64 encoding), encryptions, conversions between vcard/icalendar and SIF-C/SIF-E, and so on. The default is com/funambol/server/engine/transformer/DataTransformerManager.xml. To specify configuration parameters, click Configure (see “Data Transformer Manager Configuration Parameters” on page 25).</td>
</tr>
<tr>
<td>Strategy</td>
<td>Server JavaBean representing a SyncStrategy object. The Strategy component is responsible for defining the behavior of the synchronization engine. One of the main roles of this component is to resolve the conflicts that may arise when the same information is modified by different sources. The default is com/funambol/server/engine/Strategy.xml. To specify configuration parameters, click Configure (see “Strategy Configuration Parameters” on page 26).</td>
</tr>
</tbody>
</table>
User manager: Server JavaBean representing the user manager. This component is responsible for accessing the user database. The default is `com/funambol/server/admin/DBUserManager.xml`, which accesses the user in the local Funambol DS Server database. However, it can be customized in order to access a different database, such as a LDAP server. In that case, this parameter will reflect the custom server bean.

Min. value for max. msg size: The minimum MaxMsgSize supported by the server. If a client requests a MaxMsgSize less than this value, the request is rejected. When starting a synchronization, a device can tell the server not to send messages bigger than a certain byte amount; however, there is a lower limit under which the server may not be able to work. This limit can be influenced by some internal processing or by the amount of metadata the server needs to return. This parameter specifies the lower limit the server can accept.

Click **Save** to save the configuration settings, or **Cancel** to quit without saving the settings.
Data Transformer Manager Configuration Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transformers for incoming items</td>
<td>Specifies the name and class of transformers for incoming items.</td>
</tr>
<tr>
<td>Transformers for outgoing items</td>
<td>Specifies the name and class of transformers for outgoing items.</td>
</tr>
<tr>
<td>Data transformations</td>
<td>Specifies the source URI of items that require transformation, and the name of the transformer to use.</td>
</tr>
</tbody>
</table>

Click **Save** to save the configuration settings, or **Cancel** to quit without saving the settings.
Strategy Configuration Parameters

These settings specify the conflict resolution the Funambol DS Server uses for SyncSources.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default conflict</td>
<td>Specifies the default conflict resolution; this setting applies to those SyncSources that do not need to be configured individually, and can be used to quickly switch the conflict resolution for all such SyncSources to client wins or server wins.</td>
</tr>
<tr>
<td>value</td>
<td>Use the default conflict resolution for this SyncSource.</td>
</tr>
<tr>
<td>Server wins</td>
<td>The server wins for this SyncSource (overrides default).</td>
</tr>
<tr>
<td>Client wins</td>
<td>The client wins for this SyncSource (overrides default).</td>
</tr>
<tr>
<td>Merge data</td>
<td>Applicable only to MergeableSyncSources and must be used for such SyncSources.</td>
</tr>
</tbody>
</table>

Click **Save** to save the configuration settings, or **Cancel** to quit without saving the settings.
Log Settings

A basic installation includes a single log file called funambol_ds.log, stored in the <DS_SERVER_HOME>/logs directory. However, you can specify logging for specific server components, with the output going to separate files if desired. The system provides loggers for this purpose, as follows:

<table>
<thead>
<tr>
<th>Logger</th>
<th>Description / Filename</th>
</tr>
</thead>
<tbody>
<tr>
<td>funambol</td>
<td>The standard system logger. Filename: funambol_ds.log</td>
</tr>
<tr>
<td>funambol.engine</td>
<td>Logger for the engine. Filename: funambol_ds.engine.log</td>
</tr>
<tr>
<td>funambol.engine.pipeline</td>
<td>Logger for the pipeline manager. Filename: funambol_ds.engine.pipeline.log</td>
</tr>
<tr>
<td>funambol.engine.source</td>
<td>Logger for the engine source. Filename: funambol_ds.engine.source.log</td>
</tr>
<tr>
<td>funambol.handler</td>
<td>Logger for the handler. Filename: funambol_ds.handler.log</td>
</tr>
<tr>
<td>funambol.server</td>
<td>Logger for the server. Filename: funambol_ds.server.log</td>
</tr>
<tr>
<td>funambol.server.notification</td>
<td>Logger for server notification. Filename: funambol_ds.server.notification.log</td>
</tr>
<tr>
<td>funambol.transport</td>
<td>Logger for the transport. Filename: funambol_ds.transport.log</td>
</tr>
<tr>
<td>funambol.email</td>
<td>Logger for email. Filename: funambol_ds.email.log</td>
</tr>
</tbody>
</table>

The loggers for specific parts of the server are included in the funambol logger by default. If you want to use the logger for a server part, uncheck the Same as funambol checkbox in the settings for that logger. This allows you to specify a different log level, output type, and so on for this component. For details, see “Specifying Logger Settings for a Server Component” on page 29.
To specify the level of information, output type, and so on for the standard system logger, access the navigation pane and expand the server as follows: Server settings > Logging and select funambol. The following logging parameters display:

![Funambol Administration Tool](image)

### Logger Settings Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Logger name</td>
<td>Name of the logger.</td>
</tr>
<tr>
<td>Logging level</td>
<td>The level of information logged. Valid values: NONE = no information logged; ERROR = only errors are logged; INFO = basic info and errors are logged; ALL = info, errors and debug information are logged. Default: INFO. For server problems, or to debug the server or a syncsource, use ALL, since this provides the most information. You should also use ALL if you wish to submit a log file for consideration on Funambol mailing lists.</td>
</tr>
<tr>
<td>Output to console</td>
<td>Specifies if the log should be viewed on the standard console. Default: not selected.</td>
</tr>
<tr>
<td>Output to file</td>
<td>Specifies if the log should be stored in a file (defined in the Filename pattern field). Default: selected.</td>
</tr>
</tbody>
</table>
### Specifying Logger Settings for a Server Component

The logger settings for the Funambol engine are shown below. If you uncheck the Same as funambol checkbox, you can specify log settings specific to this server component.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Filename pattern</td>
<td>Defines the name of the file where the log is stored when the Output to file field is checked. It consists of a string that includes the following:</td>
</tr>
<tr>
<td></td>
<td>&quot;/&quot; – the local pathname separator</td>
</tr>
<tr>
<td></td>
<td>&quot;%t&quot; – the system temporary directory</td>
</tr>
<tr>
<td></td>
<td>&quot;%h&quot; – the value of the &quot;user.home&quot; system property</td>
</tr>
<tr>
<td></td>
<td>&quot;%g&quot; – an automatically generated number to distinguish rotated logs</td>
</tr>
<tr>
<td></td>
<td>&quot;%u&quot; – a unique number to resolve conflicts</td>
</tr>
<tr>
<td></td>
<td>&quot;%%&quot; – translates to a single percent sign &quot;%&quot;</td>
</tr>
<tr>
<td>File size limit</td>
<td>The maximum size of the log file in MB. Default: 100.</td>
</tr>
<tr>
<td>Rotation file count</td>
<td>Logging can either be written to a specified file, or written to a rotating set of files. For a rotating set of files, as each file reaches the file size limit, it is closed, rotated out, and a new file opened. Successively older files are named by replacing the %g placeholder in the filename pattern with &quot;0&quot;, &quot;1&quot;, &quot;2&quot;, etc. Default: 1.</td>
</tr>
</tbody>
</table>

---

#### Parameter Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Filename pattern</td>
<td>Defines the name of the file where the log is stored when the Output to file field is checked. It consists of a string that includes the following:</td>
</tr>
<tr>
<td></td>
<td>&quot;/&quot; – the local pathname separator</td>
</tr>
<tr>
<td></td>
<td>&quot;%t&quot; – the system temporary directory</td>
</tr>
<tr>
<td></td>
<td>&quot;%h&quot; – the value of the &quot;user.home&quot; system property</td>
</tr>
<tr>
<td></td>
<td>&quot;%g&quot; – an automatically generated number to distinguish rotated logs</td>
</tr>
<tr>
<td></td>
<td>&quot;%u&quot; – a unique number to resolve conflicts</td>
</tr>
<tr>
<td></td>
<td>&quot;%%&quot; – translates to a single percent sign &quot;%&quot;</td>
</tr>
<tr>
<td>File size limit</td>
<td>The maximum size of the log file in MB. Default: 100.</td>
</tr>
<tr>
<td>Rotation file count</td>
<td>Logging can either be written to a specified file, or written to a rotating set of files. For a rotating set of files, as each file reaches the file size limit, it is closed, rotated out, and a new file opened. Successively older files are named by replacing the %g placeholder in the filename pattern with &quot;0&quot;, &quot;1&quot;, &quot;2&quot;, etc. Default: 1.</td>
</tr>
</tbody>
</table>
Managing Users

The user settings specify role-based access to the Funambol DS Server. To access these settings, double-click Users in the navigation pane. The following window displays:

On this window you can perform the following:

- **Search** – to search for a user, specify a value for the Username, First or Last Name, or E-mail address and click Search. The table below the search form displays the results of your query.

- **Add User** – to add a new user, click Add. You can also right-click Users in the navigation pane and select Add User. The Add User window displays; for details, see “Add User Parameters” on page 31.

- **Edit User** – to edit the information about a user, select a row in the table below the search form and click Edit, or double-click the row. The User Details window displays; click Save to update your changes.

- **Delete User** – to delete a user, select a row in the table below the search form and click Delete. A confirmation window displays; click OK to delete the user.
Add User Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Username</td>
<td>Username.</td>
</tr>
<tr>
<td>Password</td>
<td>User’s password.</td>
</tr>
<tr>
<td>Confirm password</td>
<td>Confirmation of the user’s password.</td>
</tr>
<tr>
<td>First Name</td>
<td>User’s first name.</td>
</tr>
<tr>
<td>Last Name</td>
<td>User’s last name.</td>
</tr>
<tr>
<td>Email</td>
<td>User’s email address.</td>
</tr>
<tr>
<td>Roles</td>
<td>Role assigned to the user. Valid values: User = can perform synchronizations with the server; Administrator = can perform administrative tasks in addition to synchronizations.</td>
</tr>
</tbody>
</table>

Click **Add** to save the settings, or **Cancel** to quit without saving the settings.
Managing Devices

The device settings specify information about the devices that can connect to the Funambol DS Server. To specify these settings, double-click Devices in the navigation pane. The following window displays:

On this window you can perform the following:

- **Search** – to search for a device, specify a value for the ID, Type, or Description and click Search. The table below the search form displays the results of your query.

- **Add Device** – to add a new device, click Add. You can also right-click Devices in the navigation pane and select Add Device. The Add Device window displays; for details, see “Add Device Parameters” on page 33.

- **Edit Device** – to edit the information about a device, select a row in the table below the search form and click Edit, or double-click the row. The Device Details window displays; click Save to update your changes.

- **Delete Device** – to delete a device, select a row in the table below the search form and click Delete. A confirmation window displays; click OK to delete the device.
Click **Add** to save the settings, or **Cancel** to quit without saving the settings.

## Add Device Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ID</strong></td>
<td>The device ID, e.g., the phone IMEI for SyncML phones.</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>The device type.</td>
</tr>
<tr>
<td><strong>Timezone</strong></td>
<td>The timezone associated with the device.</td>
</tr>
<tr>
<td><strong>Charset</strong></td>
<td>The character set used for communication with the device. Valid values: UTF-8, UTF-16, ISO-8859-1, US-ASCII.</td>
</tr>
<tr>
<td><strong>Address</strong></td>
<td>IP address of the device (if applicable).</td>
</tr>
<tr>
<td><strong>Msisdn</strong></td>
<td>Msisdn of the device (i.e., the phone number).</td>
</tr>
</tbody>
</table>
| **Notification Builder** | The builder (server component) used to create notification messages for this device. Example:  
<DS_SERVER_HOME\config\com\funambol\server\notification\DSNotificationBuilder.xml |
| **Notification Sender** | The sender (server component) used to send notification messages to this device. Example:  
<DS_SERVER_HOME\config\com\funambol\server\notification\WAPSender.xml |
| **Description** | Informational text, e.g., John Smith’s phone.                                                                                               |
Managing Principals

A user can use multiple devices for data synchronization, for example, a SyncML phone, Outlook and a Pocket PC PDA. In addition, multiple users can synchronize from a single device, if they share it. Therefore, the Funambol DS Server is built around the concept of a principal, a concept that associates a user with a device. A principal is a tuple (user,device).

On this window you can perform the following:

- **Search** – to search for a principal, specify a value for the Principal Id, Username, or Device Id and click **Search**. The table below the search form displays the results of your query.

- **Add Principal** – to add a new principal, click **Add**. You can also right-click **Principals** in the navigation pane and select **Add Principal**. The Add Principal window displays; for details, see “Add Principal Parameters” on page 35.

- **Delete Principal** – to delete a principal, select a row in the table below the search form and click **Delete**. A confirmation window displays; click **OK** to delete the principal.

- **Last Synchronization Timestamps** – To display the information about the last synchronization by a principal, select a row in the table below the search form and click **Details**. The Last Synchronization Timestamps window displays. For details, see “Last Synchronization Timestamps” on page 36.
Add Principal Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Search Users</td>
<td>Search by Username, First or Last Name, or E-mail. The table below the search form displays the results of your query</td>
</tr>
<tr>
<td>Search Devices</td>
<td>Search by ID, Type, or Description. The table below the search form displays the results of your query</td>
</tr>
</tbody>
</table>

To add a principal, search for the desired user and device, select each from the respective search results table, and click Add Principal. Click Cancel to quit without adding a principal.

**NOTE:** To facilitate use of the Funambol DS Server by first-time users, the Funambol PDI Connector module includes a Synclet that bypasses the device check. When you add a user, you can synchronize your data with any device. In a real-world scenario, you would need to add the device ID (such as the phone IMEI).
Last Synchronization Timestamps

The table provides the following information about the last synchronizations of the selected principal:

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database</td>
<td>SyncSource with which the principal synchronized.</td>
</tr>
<tr>
<td>Sync Type</td>
<td>Type of synchronization.</td>
</tr>
<tr>
<td>Status</td>
<td>Sync status code.</td>
</tr>
<tr>
<td>Client anchor</td>
<td>The client anchor last used.</td>
</tr>
<tr>
<td>Server anchor</td>
<td>The server anchor last used.</td>
</tr>
<tr>
<td>Start</td>
<td>Start time of synchronization.</td>
</tr>
<tr>
<td>End</td>
<td>End time of synchronization.</td>
</tr>
</tbody>
</table>

The Reset button deletes the information on the last synchronization, which means that the next time the principal synchronizes, a slow sync will be performed.
Chapter 3  Managing Modules

The chapter provides details for installing modules to extend the functionality of the Funambol DS Server.

Topics

- Understanding Modules, page 38
- Installing Modules, page 41
Understanding Modules

The following concepts are used for defining server extensions, external data connectivity, and data synchronization:

- **Module** – a server extension that adds new functionality or modifies the existing behavior of a Funambol DS Server component. A module is a package consisting of connectors, SyncSource types, synclets, configuration files, database scripts and so on.

- **Connector** – a server extension that integrates the Funambol DS Server with an external source of data, providing support for data synchronization with that source. It contains everything required for the configuration and runtime execution of the integration module, including configuration files, code, software interfaces, and graphical user interfaces for SyncSource configuration. In addition, a connector defines SyncSource types.

- **SyncSource Type** – a template from which an instance of a SyncSource is created. It represents a specific kind of SyncSource, such as a FileSystem SyncSource that defines how data stored in directories in a file system can be accessed by the Funambol DS Server. Since the SyncSource type does not represent a specific instance, in the case of the FileSystem SyncSource, it does not identify a directory to be used for synchronization. To specify such a directory, you create an instance of the FileSystem SyncSource and configure it with the desired directory. Another example of a SyncSource type is an Exchange Server SyncSource for accessing a Microsoft Exchange account.

- **SyncSource** – the basic synchronization unit, it defines the way a set of data is made accessible to the Funambol DS Server for synchronization. A SyncSource is the entity with which a client requests synchronization. A SyncSource is uniquely identified by the server by a source URI, which the client uses to address it.

You view the modules installed in the server in the navigation pane, as shown below:
Standard Modules

The Funambol DS Server includes the following modules:

- **Foundation module** – contains the Funambol FoundationConnector. It also defines the FileSystem SyncSource type that can be used to create file system SyncSources.

- **PDI (Personal Data Interchange) module** – contains the Funambol PDICConnector and the FileSystem SyncSource type for creating file system SyncSources. This module is intended to provide easy implementation of PIM data synchronization (contacts and calendar). The PDI module provides pre-configured SyncSources ready for synchronization by just configuring the clients (see “Default Databases” on page 69). The Java GUI Plug-in and the PIM Web Demo use this module. For a demonstration of the PDI module in use, see the *Funambol DS Server Quick Start Guide*, which includes a step-by-step example of contact synchronization.

- **Database module** – contains the Funambol DBConnector used for integrating the Funambol DS Server with databases. For details, see Chapter 4, Using the DB Connector.

- **Email Connector module** – contains the Email Connector used for synchronizing email between client and server databases. For details, see Chapter 5, Using the Email Connector and Inbox Listener.
Managing SyncSources

To add or edit a SyncSource, double-click the SyncSource type (to add) or the SyncSource (to edit) in the navigation pane. A window such as the following displays:

![Edit File System SyncSource window]

**File System SyncSource Parameters**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source URI</td>
<td>The case-sensitive identifier of the SyncSource.</td>
</tr>
<tr>
<td>Name</td>
<td>The descriptive name of the SyncSource.</td>
</tr>
<tr>
<td>Type</td>
<td>MIME type of the file’s content, e.g., text/x-vcard.</td>
</tr>
<tr>
<td>Source Directory</td>
<td>Directory where files are stored and read.</td>
</tr>
<tr>
<td>Supported types</td>
<td>Comma-separated list of supported MIME types, sent in the server capabilities packet. Example: text/x-vcard, text/vcard (see Supported versions)</td>
</tr>
<tr>
<td>Supported versions</td>
<td>Comma-separated list of MIME type versions. For each MIME type specified in the Supported types field, a version number must be specified. Example: 2.1,3.0 means support for vCard 2.1 and 3.0.</td>
</tr>
<tr>
<td>Encoded</td>
<td>Specifies whether the file’s content must be Base64 encoded. This feature is useful if you are building a SyncClient and plan to transfer binary files. If your SyncSource is meant to synchronize with phones, you should leave this option unchecked.</td>
</tr>
<tr>
<td>Multiuser</td>
<td></td>
</tr>
</tbody>
</table>
Installing Modules

A module is usually distributed as a zip or jar archive. The archive might contain several files, but the primary file has the following filename syntax,

{modulename}-{versionnumber}.s4j

where modulename is the name of the module and versionnumber is the version.

Example: Funambol Email Connector Module filename
funambol-email-3.0.2.s4j

The .s4j module file contains the part of the module that becomes part of the Funambol DS Server enterprise archive (a J2EE ear file). It contains classes, configuration files, and initialization files that are processed by the installation procedure. The .s4j module file must be copied to the <DS_SERVER_HOME>\modules directory to be processed by the installation procedure.

NOTE: Funambol modules can be installed either by re-installing the entire Funambol DS Server, or by using a separate script that installs only modules. Also, if you are using the bundled installation, the server must be running before performing the installation procedure below.

Installing a Module

1. Unpack the module archive file.

2. Copy the funambol-{modulename}-{versionnumber}.s4j file to the <DS_SERVER_HOME>\modules directory.
3. Using a text editor, open the `<DS_SERVER_HOME>/install.properties` file.

4. Find the line that begins `modules-to-install=` in the Module definitions section. This line specifies, in a comma-separated list, the modules to install during installation.

5. Add `funambol-{modulename}-{versionnumber}` to the comma-separated list without the `.s4j` filename extension.

6. Save and close `install.properties`.

7. Start the server if not already running (for bundled installation users).

8. Install the module. Open a command prompt window and run the installation script by typing the following at the prompt:

   **Windows**
   
   `> cd <DS_SERVER_HOME>
   > install-modules.cmd <application_server>`

   **Unix / Linux**
   
   `> cd <DS_SERVER_HOME>
   > install-modules.sh <application_server>`

   During the installation you are prompted to create (i.e., rebuild) the database for the server. Type `n` (no) if you have data in the database that you do not want to lose, such as your existing users, mappings and previous sync information.

   In addition, as the installation procedure installs each module, you are prompted to rebuild that module’s database. Accept or decline as appropriate, but for the module that is being installed for the first time, you must type `y` (yes).

---

**Uninstalling a Module**

To uninstall a module, perform the following:

1. Open the `<DS_SERVER_HOME>/install.properties` file.

2. Find the `modules-to-install=` property and delete the module from the comma-separated list.

3. Save and close `install.properties`.

4. Reinstall the application server and rebuild the database.

**NOTE:** The `modules-to-uninstall=` property in the `install.properties` file currently is ignored, but may be implemented in future releases.
Chapter 4  Using the DB Connector

The chapter describes how you can use the Funambol DB Connector to synchronize data between client and server databases.

Topics

- *Overview, page 44*
- *Configuring a Single Table Synchronization, page 49*
- *Configuring a Partitioned Table Synchronization, page 53*
Overview

The Funambol DB Connector is a server extension that you can use to perform table-to-table database synchronization. This connector is included in a default module in the Funambol DS Server, and provides the following SyncSource types:

- **Table SyncSource** – used to create a SyncSource for synchronizing the data in a table that exists in both a client and server database.

- **Partitioned Table SyncSource** – used to create a SyncSource for synchronizing data that on the server side is stored in a data table and in a *partitioning* table. The partitioning table is used to identify the rows that belong to a particular user, so that only the data of a given user is synchronized into the client table. Note that on the client only the data table is synchronized, since the partitioning table is not needed.

These SyncSources are the key components for enabling the Funambol DS Server to synchronize data between client and server databases, as illustrated below:
Using the DB Connector

You access the DB Connector using the navigation pane:

To add a Table SyncSource instance, double-click the Table SyncSource type or right-click it and select Add SyncSource. To edit a Table SyncSource instance, double-click it or right-click and select Edit (or select Delete to delete). The Edit Table SyncSource window displays:
The Edit Partitioned Table SyncSource window has additional parameters. For details, see “Configuring the Server Partitioned Table SyncSource” on page 55.

### Edit Table SyncSource Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source URI</td>
<td>The case-sensitive identifier of the SyncSource.</td>
</tr>
<tr>
<td>Name</td>
<td>The descriptive name of the SyncSource.</td>
</tr>
<tr>
<td>Type</td>
<td>MIME type of the content, e.g., text/plain.</td>
</tr>
<tr>
<td>JNDI Name datasource</td>
<td>The JNDI name of the datasource for accessing the database.</td>
</tr>
<tr>
<td>Table name</td>
<td>The name of the database table.</td>
</tr>
<tr>
<td>Key field</td>
<td>The primary key of the table.</td>
</tr>
<tr>
<td>Last update timestamp field</td>
<td>The field containing the last modification timestamp.</td>
</tr>
<tr>
<td>Last update type field</td>
<td>The field containing the last modification type. Valid values: N = new; U = updated; D = deleted.</td>
</tr>
<tr>
<td>Principal field</td>
<td>The field containing the principal ID. If not specified, the table data will not be filtered based on the principal.</td>
</tr>
<tr>
<td>Field Mapping</td>
<td>The mapping of server and client fields, where each row represents a mapping of a server field to a client field. Select the checkbox in the Binary data column to mark a field as binary (e.g., a photo of a contact). Binary fields are encoded before sent between client and server.</td>
</tr>
</tbody>
</table>

### Edit Table SyncSource Buttons

- **Load table from db** – Displays a window that allows you to connect with a database and select a table to synchronize with. This action populates the fields in the Table Info area. For example, the Table name field displays the name of the selected table, and the Key field list box contains fields for selection. In addition, the Field Mapping table is populated with server and client fields, with a checkbox for each row to designate binary data fields.

- **New** – Adds a new row (mapping) to the Field Mapping table.

- **Remove** – Removes the selected row (mapping) from the Field Mapping table.

- **Add** – Adds a SyncSource (i.e., an instance of the SyncSource type) configured with the specified parameter values.
Adding a Table SyncSource

To add a Table SyncSource, perform the following:

1. Double-click Table SyncSource in the navigation pane.
2. Specify the Source URI, Name, Type, and JNDI Name datasource.
3. Click Load data from db. The following window displays:

   ![Load data from db window](image)

   **Load Data from DB Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Jar driver</td>
<td>JAR file containing the database driver, including the path. You can use the “…” button to browse to the desired file; you can specify multiple files.</td>
</tr>
<tr>
<td>Driver</td>
<td>Database driver class.</td>
</tr>
<tr>
<td>URL</td>
<td>Database URL.</td>
</tr>
<tr>
<td>User</td>
<td>User ID for accessing the database.</td>
</tr>
<tr>
<td>Password</td>
<td>Password for accessing the database.</td>
</tr>
<tr>
<td>Tables List</td>
<td>List of tables in the specified database.</td>
</tr>
<tr>
<td>Columns List</td>
<td>List of columns in the selected table.</td>
</tr>
</tbody>
</table>

4. Specify values for accessing the database and click Connect. This action populates the Tables List with all tables accessible with the given values.

5. Select the desired table in the Tables List. This action populates the Columns List with all columns in the selected table.
6. Click **OK** or **Cancel** to cancel the operation. When you click **OK**, you return to the Edit Table SyncSource window. The parameters in the Table Info area, such as Table name, Key field, and so on, are now populated with the fields of the selected table. In addition, the Field Mapping table is populated with server and client fields, with a checkbox for each row to designate binary data fields.

7. Select the desired field for the parameters in the Table Info area. The fields you select are highlighted in the Field Mapping table. For example, when you make a selection for Key field, the selected field is highlighted in the table.

8. Add or remove mappings in the Field Mapping table as desired, using the **New** or **Remove** buttons.

9. Click **Add** to create the SyncSource instance.
Configuring a Single Table Synchronization

To set up synchronization between client and server for a single table, you use the Table SyncSource type provided in the DB Connector. In this example, the entire table is synchronized, and data is filtered based on the principal ID, such that each principal only synchronizes the data that belongs to it. The table fields on the client and on server are shown below:

On the client, the table must have fields containing the following:

- Primary key of the table
- Last modification type, where the valid values are N, U, and D. For details, see “Edit Table SyncSource Parameters” on page 46.

On the server, the table must have fields containing the following:

- Primary key of the table.
- Last modification timestamp.
- Last modification type, where the valid values are N, U, and D.
- A field containing the ID of the principal associated with a record is optional. If non-existent, table data will not be filtered based on the principal.

To review the architecture of the synchronization, see “Overview” on page 44. You create a Table SyncSource for the server and a Table SyncSource for the client to access the data in their respective databases.
Configuring the Server Table SyncSource

To create an instance of the server Table SyncSource, see “Adding a Table SyncSource” on page 47. A sample configuration is shown below:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source URI</td>
<td>./contactDB</td>
</tr>
<tr>
<td>Name</td>
<td>contactDB</td>
</tr>
<tr>
<td>Type</td>
<td>text/plain</td>
</tr>
<tr>
<td>JNDI Name</td>
<td>jdbc/fnblds</td>
</tr>
<tr>
<td>Table name</td>
<td>contact</td>
</tr>
<tr>
<td>Key field</td>
<td>id_contact</td>
</tr>
<tr>
<td>Last update timestamp field</td>
<td>update_date</td>
</tr>
<tr>
<td>Last update type field</td>
<td>update_type</td>
</tr>
<tr>
<td>Principal field</td>
<td>id_principal</td>
</tr>
<tr>
<td>Field Mapping</td>
<td>first_name</td>
</tr>
<tr>
<td></td>
<td>last_name</td>
</tr>
<tr>
<td></td>
<td>phone_number</td>
</tr>
<tr>
<td></td>
<td>mobile</td>
</tr>
<tr>
<td></td>
<td>email</td>
</tr>
<tr>
<td></td>
<td>address</td>
</tr>
<tr>
<td></td>
<td>city</td>
</tr>
<tr>
<td></td>
<td>zip</td>
</tr>
<tr>
<td></td>
<td>state</td>
</tr>
<tr>
<td>Binary fields</td>
<td>None</td>
</tr>
</tbody>
</table>

For parameter definitions, see “Edit Table SyncSource Parameters” on page 46.

Configuring the Client Table SyncSource

The DB Connector provides a client Table SyncSource for use with the Funambol Client API J2SE. This SyncSource is implemented in com.funambol.db.client.engine.source.TableSyncSource. The underlying table must have a field to handle the state of each record. This field is configurable into the management panel of the SyncSource.
The client Table SyncSource is configured with the following parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>The name of the table.</td>
</tr>
<tr>
<td>keyField</td>
<td>The primary key field.</td>
</tr>
<tr>
<td>updateTypeField</td>
<td>The field containing the last update type.</td>
</tr>
<tr>
<td>fieldsList</td>
<td>A comma-separated list of the fields.</td>
</tr>
<tr>
<td>binaryFields</td>
<td>A comma-separated list of the binary fields.</td>
</tr>
</tbody>
</table>

A sample of the configuration file (including standard SyncSource parameters) is shown below:

```
#Fri Feb 18 18:22:15 CET 2005
syncModes=none, slow, two-way, one-way, refresh
name=dbcontact
sourceURI=./dbcontact
sourceClass=com.funambol.db.client.engine.source.TableSyncSource
keyField=id
fieldsList=first_name, last_name, phone_number, mobile, email, address, city, zip, state
updateTypeField=update_type
type=text/clear
sync=two-way
tableName=contact
last=1108747334979
description=dbcontact
```

**Database Access**

A DBMS capable of running on a PDA usually has restrictions and limitations. For example, it may not be available via JNDI or may not allow more than one open connection at a time. In addition, the overhead for getting a connection may be substantial. Therefore, the Table SyncSource class can use an external connection factory for the connection to the database.

The connection factory is represented by the interface `com.funambol.db.client.ConnectionFactory` and can be provided by the client application. This allows the SyncSource to use an existing database connection. The `com.funambol.db.client.ConnectionFactory` class defines the following methods:

- `getConnection()`: `Connection` – returns a database connection
- `closeConnection(con: Connection): void` – closes the database connection

The DB module reads the device management node `db/connectionfactory` to obtain an instance of a connection factory. The properties of this node are used to create a connection factory; the property `className` contains the class name to use.
An example of the device management node `db/connectionfactory` is shown below:

```java
className=com.funambol.db.clientConnectionFactoryImpl
driver=com.mysql.jdbc.Driver
url=jdbc:mysql://localhost/testdbcontact
user=testdbcontact
password=testdbcontact
```

All properties (except `className`) are used to configure the instance calling the respective setter methods (set + property name capitalized).

The DB module also provides `com.funambol.db.client.ConnectionFactoryImpl`, a simple connection factory that opens a new connection to the database for all calls to the `getConnection()` method. The method `closeConnection()` closes the connection. The following configuration parameters are used:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>driver</td>
<td>The driver to access the database.</td>
</tr>
<tr>
<td>url</td>
<td>The URL to access the database.</td>
</tr>
<tr>
<td>user</td>
<td>The user to access the database.</td>
</tr>
<tr>
<td>password</td>
<td>The password to access the database.</td>
</tr>
</tbody>
</table>

For an example of a connection factory with a single connection to the database, see “Connection Factory Sample” on page 72.
Configuring a Partitioned Table Synchronization

For this synchronization you use the Partitioned Table SyncSource type provided in the DB Connector. In this case, the association between a row of the data table on the server, and the owner (i.e., principal) of that row, is stored in a principal table, referred to as a partitioning table. The primary issue is that modifications to both the data table and the partitioning table must be reflected on the client.

For example, suppose the data table contains customer data and the partitioning table contains the sales agent that deals with a particular customer (thus it contains the agent-customer 1:N relationship). A row on the client must be deleted under the following conditions:

- A customer is deleted.
- A customer is associated to another principal.

The table fields on the client and on server are shown below:

<table>
<thead>
<tr>
<th>Client Table</th>
<th>Server Tables</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Table X</strong></td>
<td><strong>Table X (data table)</strong></td>
</tr>
<tr>
<td><code>luid</code></td>
<td><code>guid</code></td>
</tr>
<tr>
<td><code>...</code></td>
<td><code>...</code></td>
</tr>
<tr>
<td><code>m</code></td>
<td><code>t</code></td>
</tr>
<tr>
<td><code>p</code> — principal ID</td>
<td><code>m</code> — last modification flag</td>
</tr>
<tr>
<td><code>luid / guid</code> — primary keys</td>
<td><code>guid</code></td>
</tr>
</tbody>
</table>

On the client, the table must have fields containing the following:

- Primary key of the table
- Last modification type, where the valid values are S, N, U, and D. For details, see “Edit Table SyncSource Parameters” on page 46.
On the server, the data table must have fields containing the following:

- Primary key of the table.
- A “guid” field (can be the preceding field)
- Last modification timestamp.
- Last modification type, where the valid values are S, N, U, and D.

The partitioning table must have fields containing the following:

- Principal ID of the principal.
- A “guid” field used to link the principal with a record in the data table
- Last modification timestamp.
- Last modification type, where the valid values are S, N, U, and D.

To review the architecture of the synchronization, see “Overview” on page 44. You create a Partitioned Table SyncSource for the server and a Table SyncSource for the client to access the data in their respective databases.
Configuring the Server Partitioned Table SyncSource

To create an instance of the server Partitioned Table SyncSource, review “Adding a Table SyncSource” on page 47. The procedure is essentially the same, with the following exceptions:

- In Step 1, you select **Partitioned Table SyncSource** in the navigation pane instead of **Table SyncSource**.

- The Edit Partitioned Table SyncSource window has additional parameters; specifically, the **Table Info** area of the Table SyncSource window is replaced with **Partitioning Table** and **Data Table**, and each has a **Load data from db** button for populating the fields, as shown below:

![Edit Partitioned Table SyncSource](image)

The parameter definitions in “Edit Table SyncSource Parameters” on page 46 apply to this window. An additional **Link field** parameter is defined as follows:

- In the partitioning table, this is the field used to get the records from the data table (the “guid”)
- In the data table, this is the “guid” field (which can be the key field).
A sample configuration is shown below:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source URI</td>
<td>./customerDB</td>
</tr>
<tr>
<td>Name</td>
<td>customerDB</td>
</tr>
<tr>
<td>Type</td>
<td>text/plain</td>
</tr>
<tr>
<td>JNDI Name datasource</td>
<td>jdbc/fnblds</td>
</tr>
</tbody>
</table>

**Partitioning Table**

<table>
<thead>
<tr>
<th>Table name</th>
<th>agent_customer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Principal field</td>
<td>id_principal</td>
</tr>
<tr>
<td>Link field</td>
<td>id_customer</td>
</tr>
<tr>
<td>Last update timestamp field</td>
<td>update_date</td>
</tr>
<tr>
<td>Last update type field</td>
<td>update_type</td>
</tr>
</tbody>
</table>

**Data Table**

<table>
<thead>
<tr>
<th>Table name</th>
<th>customer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key field</td>
<td>id_customer</td>
</tr>
<tr>
<td>Link field</td>
<td>id_customer</td>
</tr>
<tr>
<td>Last update timestamp field</td>
<td>update_date</td>
</tr>
<tr>
<td>Last update type field</td>
<td>update_type</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field Mapping</th>
<th>country</th>
<th>country</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>street</td>
<td>street</td>
</tr>
<tr>
<td></td>
<td>postal_code</td>
<td>postal_code</td>
</tr>
<tr>
<td></td>
<td>state</td>
<td>state</td>
</tr>
<tr>
<td></td>

**Configuring the Client Table SyncSource**

The procedure for configuring the client is the same as described in “Configuring the Client Table SyncSource” on page 50.
Chapter 5  Using the Email Connector and Inbox Listener

The chapter describes how to configure the email connector and inbox listener to synchronize email between client and server databases.

Topics

- Configuring the Email Connector, page 58
- Implementing the Inbox Listener, page 63
Configuring the Email Connector

To configure the email connector, you perform the following actions:

- Configure the Officer
- Configure the connector
- Create a SyncSource
- Set the log level

Configuring the Officer

The Officer is a Server JavaBean that is responsible for authenticating users and authorizing access to DS server resources. To set the Officer for the email connector, perform the following:

1. Start the DS Server and open the Administration Tool.
2. In the navigation pane on the left, expand the server and double-click **Server settings**. The server parameters display on the right as shown below:

3. In the Officer field, specify `com/funambol/server/security/EmailOfficer.xml`.
4. Click **Save** to save the configuration settings. For additional details on server settings, see the “Server Settings” on page 21.
Configuring the Connector

To configure the email connector, perform the following:

1. Start the DS Server and open the Administration Tool (if not already open).

2. In the navigation pane on the left, expand the server tree as follows: [server] > Modules > email > FunambolEmailConnector. The email connector parameters display on the right as shown below:

```
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mail Server</td>
<td>Outgoing mail server URL.</td>
</tr>
<tr>
<td>Protocol</td>
<td>Email protocol used by the Officer.</td>
</tr>
<tr>
<td>Port</td>
<td>Email server port used by the Officer.</td>
</tr>
<tr>
<td>SSL</td>
<td>Specifies whether the SSL protocol is used.</td>
</tr>
<tr>
<td>Keystore Path</td>
<td>Path to the Java keystore for SSL (enabled when SSL is checked).</td>
</tr>
<tr>
<td>Keystore Passphrase</td>
<td>Password phrase for the Java keystore (enabled when SSL is checked).</td>
</tr>
<tr>
<td>Funambol DataSource</td>
<td>Data source used by the caching system.</td>
</tr>
<tr>
<td>Filter Activation</td>
<td>Specifies whether to activate filters.</td>
</tr>
</tbody>
</table>
```

3. Specify the parameter values and click Save to save the configuration settings.
**Creating a SyncSource**

To create an IMAP or POP3 SyncSource for the email connector, perform the following:

1. Start the DS Server and open the Administration Tool (if not already open).

2. In the navigation pane on the left, expand the server tree as follows: [server] > Modules > email > FunambolEmailConnector and select Email Imap SyncSource or Email Pop3 SyncSource. The parameters are identical for an IMAP or POP3 SyncSource; Email Imap SyncSource is shown selected below. Note that certain parameters are unavailable or read-only for each, and these differ depending on the protocol selected.

![Email Connector SyncSource Configuration Parameters](image)

### Email Connector SyncSource Configuration Parameters

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source URI</td>
<td>The case-sensitive identifier of the SyncSource (e.g., mail1).</td>
</tr>
<tr>
<td>Name</td>
<td>The descriptive name of the SyncSource.</td>
</tr>
<tr>
<td>Outgoing Server</td>
<td>Outgoing email server URL.</td>
</tr>
<tr>
<td></td>
<td>Port: default = 25 (SMTP).</td>
</tr>
<tr>
<td></td>
<td>Auth: if checked, the user credential is sent to the email server to authenticate the outgoing mail.</td>
</tr>
<tr>
<td>Incoming Server</td>
<td>Incoming email server URL.</td>
</tr>
<tr>
<td></td>
<td>Port: default = 110 (POP3), 143 (IMAP).</td>
</tr>
<tr>
<td>SSL</td>
<td>Specifies whether the SSL protocol is used.</td>
</tr>
<tr>
<td>Keystore Path</td>
<td>Path to the Java keystore for SSL (enabled when SSL is checked).</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Keystore Passphrase</td>
<td>Password phrase for the Java keystore (enabled when SSL is checked)</td>
</tr>
<tr>
<td>Complete Mailbox Activation</td>
<td>Specifies whether to synchronize the entire mailbox, or only the main default folders – Inbox, Outbox, Sent, Drafts, and Trash (currently unavailable).</td>
</tr>
<tr>
<td>Inbox Folder Name</td>
<td>Server label for the inbox folder. Supported for IMAP and POP3. Check box on the right to synchronize (required).</td>
</tr>
<tr>
<td>Outbox Folder Name</td>
<td>Server label for the outbox folder. Supported for IMAP only. Check box on the right to synchronize (required).</td>
</tr>
<tr>
<td>Sent Folder Name</td>
<td>Server label for the sent folder. Supported for IMAP only. Check the box on the right to synchronize (required).</td>
</tr>
<tr>
<td>Drafts Folder Name</td>
<td>Server label for the drafts folder. Supported for IMAP only. Check the box on the right to synchronize (optional).</td>
</tr>
<tr>
<td>Trash Folder Name</td>
<td>Server label for the trash folder. Supported for IMAP only. Check the box on the right to synchronize (optional).</td>
</tr>
<tr>
<td>Type</td>
<td>Email object type information (read-only).</td>
</tr>
<tr>
<td>Supported Types</td>
<td>Email object supported types information (read-only).</td>
</tr>
<tr>
<td>Supported Versions</td>
<td>Email object supported versions information (read-only).</td>
</tr>
<tr>
<td>Encryption/Encoding</td>
<td>Specifies whether to encrypt/encode email. If you select this box and save the settings, an entry for this SyncSource is automatically added to the Data transformations table (see “Data Transformer Manager Configuration Parameters” on page 25) with des;b64 transformation. If you uncheck the box and save the settings, the SyncSource is removed from the Data transformations table. You can also set up email encryption/encoding manually in the Data transformations table, as follows:</td>
</tr>
<tr>
<td></td>
<td>1. In the Data transformations table, click the “+” icon in the upper right corner. This creates a new row at the bottom of the table.</td>
</tr>
<tr>
<td></td>
<td>2. In the Source URI column, specify the value of the Source URI (e.g., the string mail) of the SyncSource.</td>
</tr>
<tr>
<td></td>
<td>3. In the Transformation column, specify des;b64 for the DES cipher and Base64 encoding.</td>
</tr>
<tr>
<td></td>
<td>4. Click Save to save the configuration settings.</td>
</tr>
<tr>
<td></td>
<td>5. Specify the parameter values and click Add to create the SyncSource.</td>
</tr>
</tbody>
</table>
Modifying Log Settings

To specify the level of information, output type, and so on for the email connector, perform the following:

1. Start the DS Server and open the Administration Tool (if not already open).

2. In the navigation pane on the left, expand the server tree as follows: Server settings > Logging and select funambol.email. The Logger settings display on the right as shown below:

3. Specify the desired values and click Save to save the log settings.

For additional information on log settings, see “Log Settings” on page 27.
Implementing the Inbox Listener

This section provides details for configuring and starting the inbox listener.

Configuring the Inbox Listener

Navigate to the `<FUNAMBOL_HOME>\inbox-listener\config\email\email` directory and open the `InboxListener.xml` file. Edit the following properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>listnerid</td>
<td>Id of the inbox listener.</td>
</tr>
<tr>
<td>startupNotification</td>
<td>Send notification to all registered users when the inbox listener module starts.</td>
</tr>
<tr>
<td>host</td>
<td>Email server URL.</td>
</tr>
<tr>
<td>protocol</td>
<td>Email protocol.</td>
</tr>
<tr>
<td>port</td>
<td>Email server port.</td>
</tr>
<tr>
<td>isSSL</td>
<td>Specifies whether SSL protocol is used.</td>
</tr>
<tr>
<td>keystorePath</td>
<td>Path to the Java keystore for SSL (when isSSL is true).</td>
</tr>
<tr>
<td>keystorePassphrase</td>
<td>Password phrase for the Java keystore (when isSSL is true).</td>
</tr>
<tr>
<td>interval</td>
<td>Interval at which to poll the user mailbox, specified in milliseconds.</td>
</tr>
<tr>
<td>jdbcDriver</td>
<td>Database driver.</td>
</tr>
<tr>
<td>jdbcUrl</td>
<td>Database URL.</td>
</tr>
<tr>
<td>jdbcUser</td>
<td>User ID to access the database.</td>
</tr>
<tr>
<td>jdbcPassword</td>
<td>Password to access the database.</td>
</tr>
<tr>
<td>reloadingTime</td>
<td>Interval at which the inbox listener checks the list of accounts in the database; specified in milliseconds.</td>
</tr>
<tr>
<td>wsEndPoint</td>
<td>Funambol engine administration URL.</td>
</tr>
<tr>
<td>wsUsername</td>
<td>Funambol engine administrator username.</td>
</tr>
<tr>
<td>wsPassword</td>
<td>Funambol engine administrator password.</td>
</tr>
<tr>
<td>wsSyncSource</td>
<td>Name of the email SyncSource.</td>
</tr>
</tbody>
</table>
Configuring the Log Level

To configure the log level of the inbox listener, perform the following:

1. Navigate to the `<FUNAMBOL_HOME>/inbox-listener/bin` directory and open the `inboxlistenerlog.properties` file.

2. Edit the `.level=` property. Valid values: NONE = no information logged; ERROR = only errors are logged; INFO = basic info and errors are logged; ALL = info, errors and debug information are logged. Default = INFO.

3. Save and close `inboxlistenerlog.properties`.

Starting and Stopping the Inbox Listener

This section provides details for starting and stopping the inbox listener, and managing the user account database.

Starting the Inbox Listener

To start the inbox listener, open a command prompt window and type the following at the prompt:

**Windows:**
```
> cd <FUNAMBOL_HOME>/inbox-listener/bin
> startlistener
```

**Unix/Linux:**
```
> cd <FUNAMBOL_HOME>/inbox-listener/bin
> sh startlistener.sh
```

Stopping the Inbox Listener

To stop the inbox listener, kill the process, e.g., use the Ctrl - c key combination.
Managing the User Account Database

Before running the inbox listener you need to populate the user email account database.

1. Open a command prompt window and type the following at the prompt:

   **Windows:**
   ```
   > cd <FUNAMBOL_HOME>/inbox-listener\bin
   > console
   ```

   **Unix/Linux:**
   ```
   > cd <FUNAMBOL_HOME>/inbox-listener/bin
   > sh console.sh
   ```

2. The Inbox Listener Account Console window displays, as shown below:

   Use the console commands for the following actions:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 – quit</td>
<td>Exits the console.</td>
</tr>
<tr>
<td>1 – list accounts</td>
<td>Displays a list of user accounts, showing the username and Id of the listener associated with the username.</td>
</tr>
</tbody>
</table>
   | 2 – insert account | Adds user account data; specify the following:
   | | • **username** – name of the user account
   | | • **password** – password for the user account
   | | • **listener id (number)** – Id (number) of the listener associated with the user account. |
   | 3 – delete account | Deletes a user account by specifying the username. |

# Default Databases

The Funambol DS Server provides the following default databases to which you can synchronize:

**NOTE:** URIs are case sensitive.

## Calendar

Usage: synchronizing calendar data.

<table>
<thead>
<tr>
<th>URI</th>
<th>MIME-TYPE</th>
<th>Clients</th>
</tr>
</thead>
<tbody>
<tr>
<td>scal</td>
<td>text/x-s4j-sife</td>
<td>All Funambol-developed clients</td>
</tr>
<tr>
<td>cal</td>
<td>text/x-vcalendar</td>
<td>Most of the common and known clients that are already built into a mobile device.</td>
</tr>
</tbody>
</table>

## Contacts

Usage: synchronizing contact data.

<table>
<thead>
<tr>
<th>URI</th>
<th>MIME-TYPE</th>
<th>Clients</th>
</tr>
</thead>
<tbody>
<tr>
<td>scard</td>
<td>text/x-s4j-sifc</td>
<td>All Funambol-developed clients</td>
</tr>
<tr>
<td>card</td>
<td>text/x-vcard</td>
<td>Most of the common and known clients that are already built into a mobile device.</td>
</tr>
</tbody>
</table>

## Notes

Usage: synchronizing text-based notes.

<table>
<thead>
<tr>
<th>URI</th>
<th>MIME-TYPE</th>
<th>Clients</th>
</tr>
</thead>
<tbody>
<tr>
<td>snote</td>
<td>text/x-s4j-sifn</td>
<td>All Funambol-developed clients</td>
</tr>
<tr>
<td>note</td>
<td>text/plain</td>
<td>Most of the common and known clients that are already built into a mobile device.</td>
</tr>
</tbody>
</table>

## Tasks

Usage: synchronizing task data.

<table>
<thead>
<tr>
<th>URI</th>
<th>MIME-TYPE</th>
<th>Clients</th>
</tr>
</thead>
<tbody>
<tr>
<td>stask</td>
<td>text/x-s4j-sift</td>
<td>All Funambol-developed clients</td>
</tr>
</tbody>
</table>
**Briefcase**

Usage: synchronizing briefcase data.

<table>
<thead>
<tr>
<th>URI</th>
<th>MIME-TYPE</th>
<th>Clients</th>
</tr>
</thead>
<tbody>
<tr>
<td>briefcase</td>
<td>Application/*</td>
<td>All Funambol-developed clients</td>
</tr>
</tbody>
</table>
## Install Properties

The `<DS_SERVER_HOME>/install.properties` file is the central repository of configuration information that is used by the installation procedure to set up the Funambol DS Server. It is a standard Java properties file that contains the following parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>context-path</td>
<td>The context path to be used to configure the web container for the Funambol DS Server module. The DS Server will respond to URLs starting with this context path.</td>
</tr>
<tr>
<td>dbms</td>
<td>Name of the database where Funambol DS Server tables are created.</td>
</tr>
<tr>
<td>jdbc.classpath</td>
<td>Classpath including the JDBC driver for the database, if not included in the system classpath.</td>
</tr>
<tr>
<td>jdbc.driver</td>
<td>JDBC driver class.</td>
</tr>
<tr>
<td>jdbc.password</td>
<td>Database user password</td>
</tr>
<tr>
<td>jdbc.url</td>
<td>JDBC connection URL</td>
</tr>
<tr>
<td>modules-to-install</td>
<td>Comma-separated list of Funambol DS Server modules to install. If a module has already been installed, the installation procedure reinstalls it again.</td>
</tr>
<tr>
<td>server-name</td>
<td>The server URI that will be specified in SyncML messages. The server will only respond to messages addressed to this URI.</td>
</tr>
</tbody>
</table>
Connection Factory Sample

The following is an example of a simple connection factory that uses a single connection to access to a database.

```java
/**

 */
package com.funambol.db.client.test;

import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.SQLException;

/**
 * This is an example of a simple ConnectionFactory that guarantees to use
 * only one connection to the database.
 */
public class SimpleConnectionFactoryImpl implements com.funambol.db.client.ConnectionFactory {

    // ----------------------------------------------------------- Constants
    // -------------------------------------------------------- Private data
    private String driver   = null;
    private String url      = null;
    private String user     = null;
    private String password = null;
    private static Connection conn   = null;

    /**
     * Open a new connection if there isn't one.
     * @return Connection
     * @throws SQLException
     */
    public Connection getConnection() throws SQLException {
        if (conn == null) {
            connect();
        }
        return conn;
    }

```

/**
 * This implementation doesn't close the connection
 * @param conn Connection
 */
public void closeConnection(Connection conn) {
}

/**
